Interannual controls of the phytoplankton assemblages in Baffin Bay

JGR: Biogeosciences

- Description of:

Data S2: Winter nitrate and silicate concentrations for the 121 sensitivity simulations.

Forcing fields of nitrate and silicate concentrations from January 1 to May 15 for the 121 sensitivity experiments, respectively. They don't correspond to observations. They were constructed by multiplying the observed vertical profiles by a factor to get a nutrient concentration of $xx \text{ uM}$ at 100 m where xx is in the name of the file. See https://github.com/maximebenoitgagne/gud_groups/blob/gud/gud_1d_35%2B16/input_noradtrans/input/data_rbc.ipynb for more details.

Each binary file contains 75 values each consisting in a four-bytes float in big endian. Their units are $\text{mM} = \text{mmol m}^{-3}$. These 75 values correspond to the depth profile of the configuration available in the variable RC of grid.t001.nc.
